Нахождение центров кластеров рядов для отбора в обучающую выборку для predictive clustering

In [11]:
```
import numpy as np
import pandas as pd
import json
import os
import time
import glob
import datetime
import matplotlib.pyplot as plt
from tqdm import tqdm
from datetime import datetime
from tslearn.preprocessing import TimeSeriesScalerMinMax
from scipy.spatial.distance import pdist, squareform
from scipy.cluster.hierarchy import ward, dendrogram, ClusterWarning, fcluster
from collections import defaultdict
from statsdistance import dtw
from tslearn.barycenters import softdtw_barycenter
```

Поскольку формирование выборки для predictive clustering по Уишарту по абсолютно всем 346394 рядам чисто технически очень сложно и объемно, необходимо сделать эту обучающую выборку наиболее точной. Во время торговли трейдер на основе сканера и watchlista сам будет отбирать потенциальные дампы и пампы, ему будет важно лишь знать примерное движение цены после характерного паттерна. Формирование обучающей выборки для пампов требует большего времени и признаков, не только цен, поэтому сосредоточимся на дампах.

In [12]:
```
# загрузим всю выборку
df_p = pd.read_csv('train_data_10pct.csv', usecols=['ticker','date','High-Low range','15m candle coverage','pos_neg_coverage','number of prints'])
df_p
```

Out[12]:

	ticker	date	High-Low range	15m candle coverage	pos_neg_coverage	number of prints

            pass
```

Далее рассмотрим все подпапки и отберем нужные кластеры из уже 48 кластеров вручную, чтобы по ним можно было найти центры кластеров. Останется 1176 наблюдений, наиболее ярких представителей своих кластеров.

In [ ]:
```
# отобранные визуально и руками папки и графики нужных кластеров
all_imgs = []
parent_dir = 'C:/Users/Kuanysh/Downloads/pump_and_dump/clusters_small'
folders = glob.glob(parent_dir + '/*')
for folder in folders:
    imgs = glob.glob(folder + '/*')
    all_imgs.extend(imgs)

# по отобранным графикам создадим список:
new_list = []
for item in all_imgs:
    new_item = item.split("\\")[2].split(".")[0]
    new_list.append(new_item)

# по созданному списку создадим датасет из рядов
time_series = []
for item in new_list:
    parent_dir_train = 'C:/Users/Kuanysh/Downloads/pump_and_dump/train3'
    ts = pd.read_csv(os.path.join(parent_dir_train, item + ".csv")).to_numpy().ravel()
    time_series.append(ts)
```

In [ ]:
```
# отскакиируем все имена графиков:
all_imgs2 = []
parent_dir = 'C:/Users/Kuanysh/Downloads/pump_and_dump/clusters_3'
folders = glob.glob(parent_dir + '/*')
for folder in folders:
    imgs = glob.glob(folder + '/*')
    all_imgs2.extend(imgs)

# и создадим список имен
correct_list2 = []
for item in all_imgs2:
    new_item = item.split("\\")[2].split(".")[0]
    correct_list2.append(new_item)
correct_list2 = np.array(correct_list2).reshape(len(correct_list2),1)
#np.save('correct_list_filtered.npy', correct_list2)
```

In [131]:
```
correct_list2 = np.load('correct_list_filtered.npy', allow_pickle=True)

# по созданному списку создадим датасет из рядов
time_series2 = []
for cluster, name in correct_list2:
    parent_dir = 'C:/Users/Kuanysh/Downloads/pump_and_dump/train3'
    ts = pd.read_csv(os.path.join(parent_dir, name + ".csv")).to_numpy().ravel().tolist()
    time_series2.append([cluster, ts])
print(len(time_series2))

# запустим словарь для кластеров
d = defaultdict(list)
for x, y in time_series2:
    d[x].append(y)
```

```
1176
```

Теперь по каждому классу найдем его barycenter и используем soft-DTW:

(https://tslearn.readthedocs.io/en/stable/user_guide/dtw.html#barycenters)

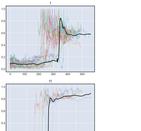
In [ ]:
```
barycenters = []
for keys, values in d.items():
    barycenter = softdtw_barycenter(values, gamma=0.1)
    barycenters.append(barycenter)
#np.save('barycenters.npy',barycenters)
```

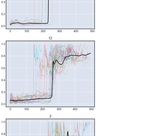
In [121]:
```
barycenters = np.load('barycenters.npy', allow_pickle=True)
```

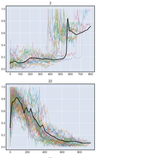
Посмотрим какие центры кластеров подойдут:

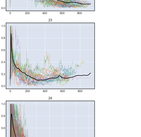
In [1338]:
```
pictures_dir = 'C:/Users/Kuanysh/Downloads/pump_and_dump/filtered_clusters'

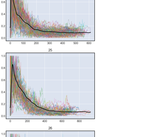
for i, key in enumerate(list(d.keys())):
    plt.figure()
    plt.title(str(key))
    for g in d[key]:
        plt.plot(g, alpha=0.5, linewidth=0.5)
    plt.plot(barycenters[i], color = 'black')
    file = os.path.join(pictures_dir, str(key) +'.png')
    plt.savefig(file, dpi=300)
    plt.show()
```

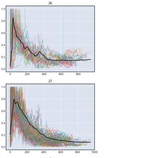


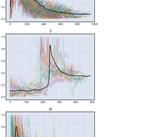


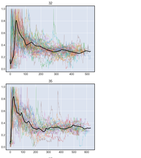


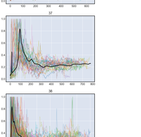


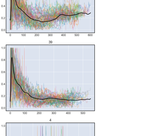


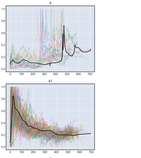


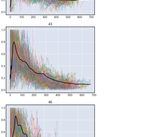


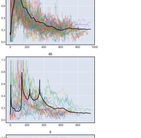


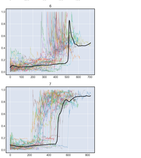


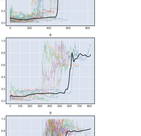


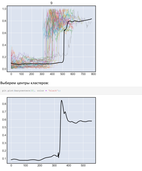


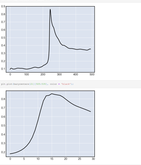


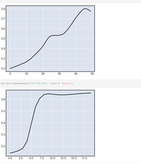




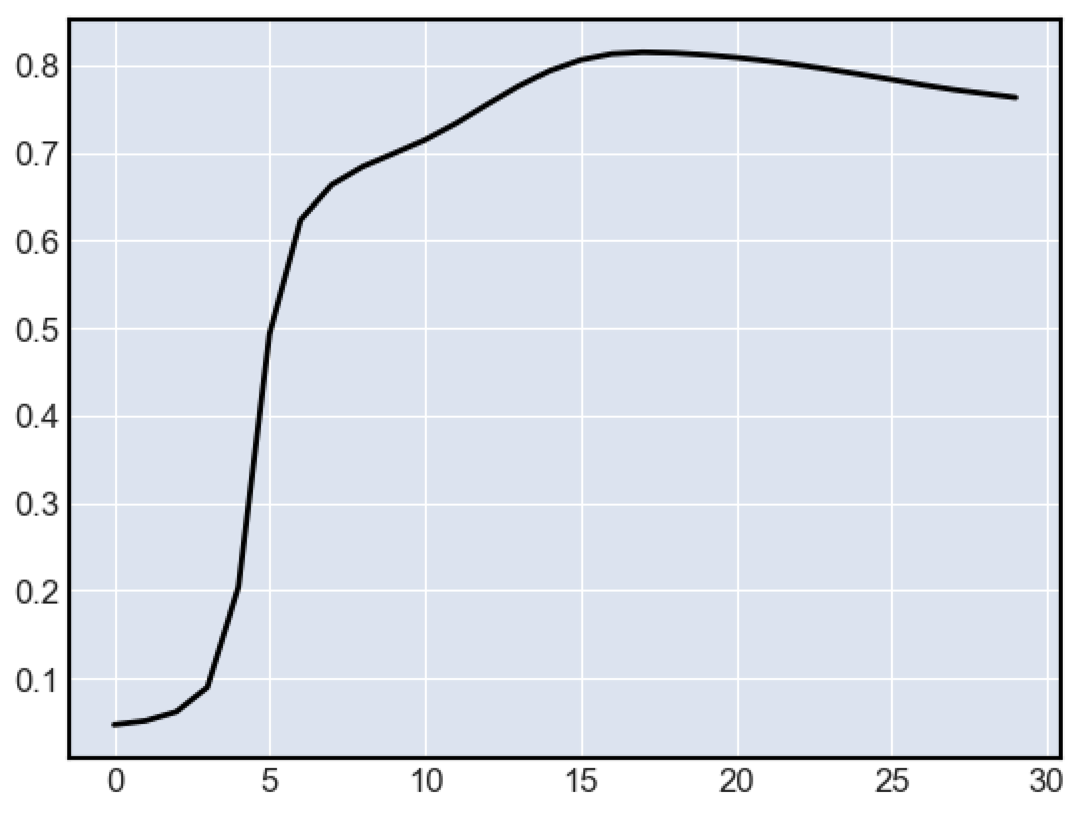




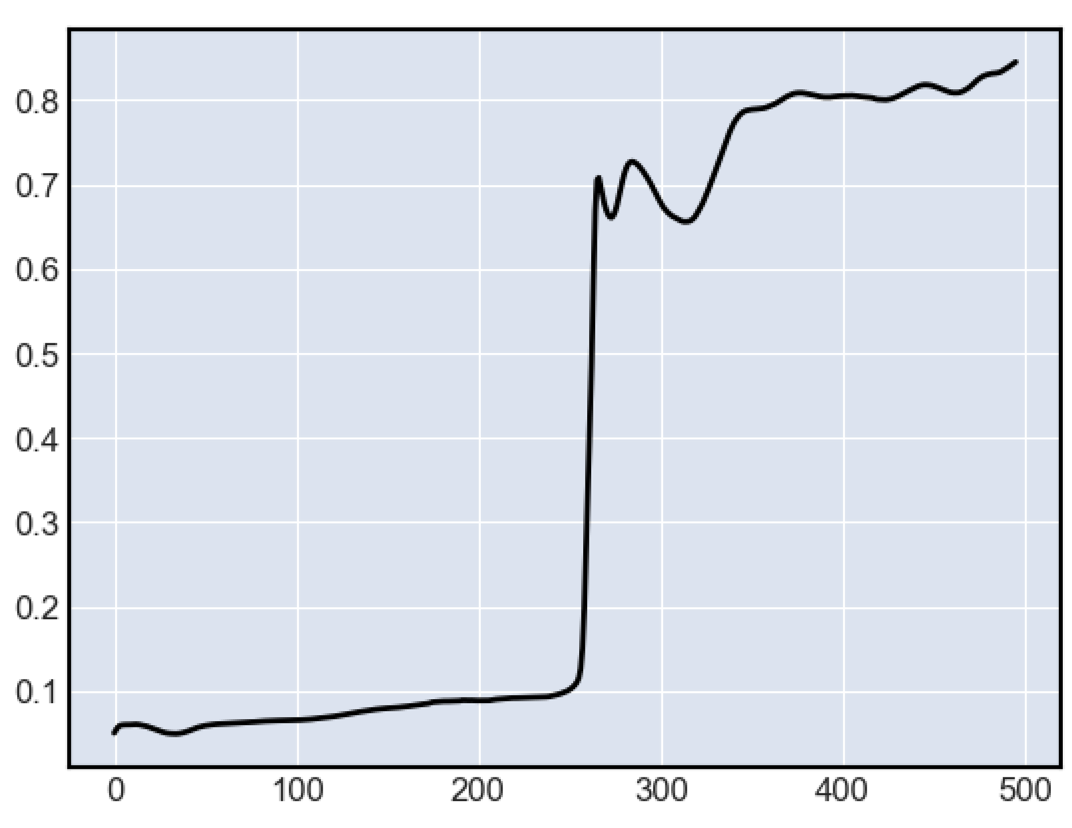




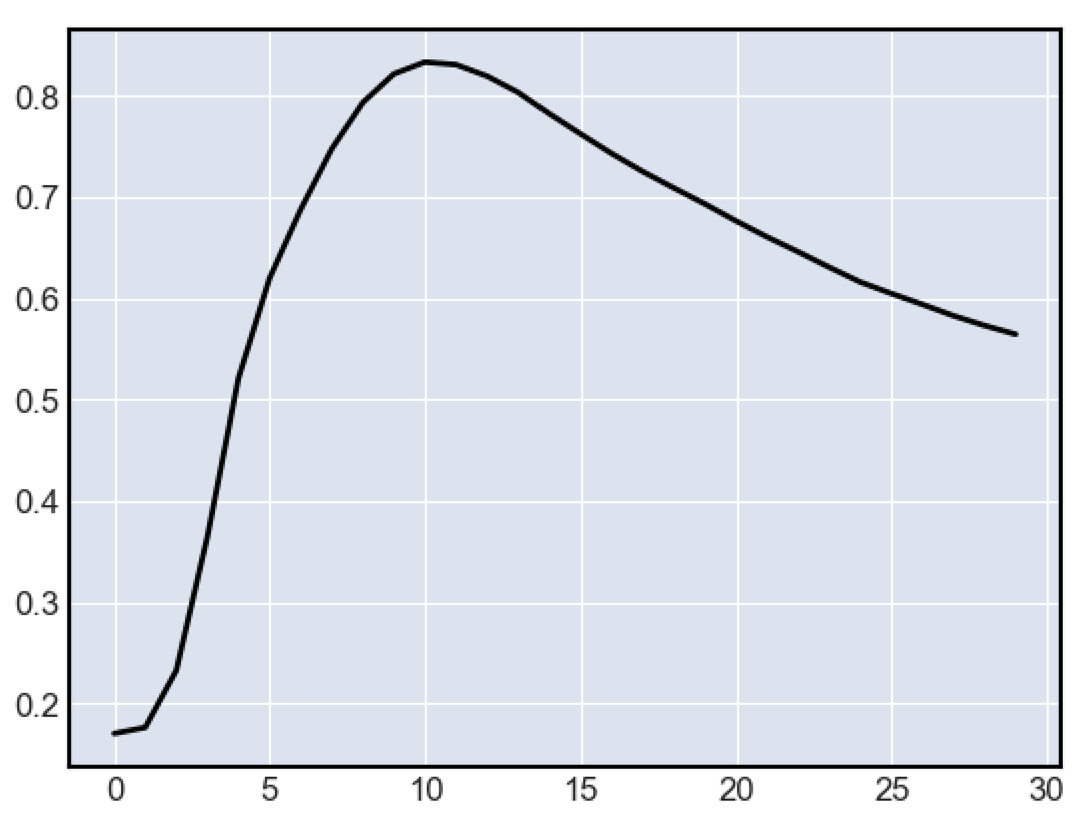
Выбрали центры кластеров



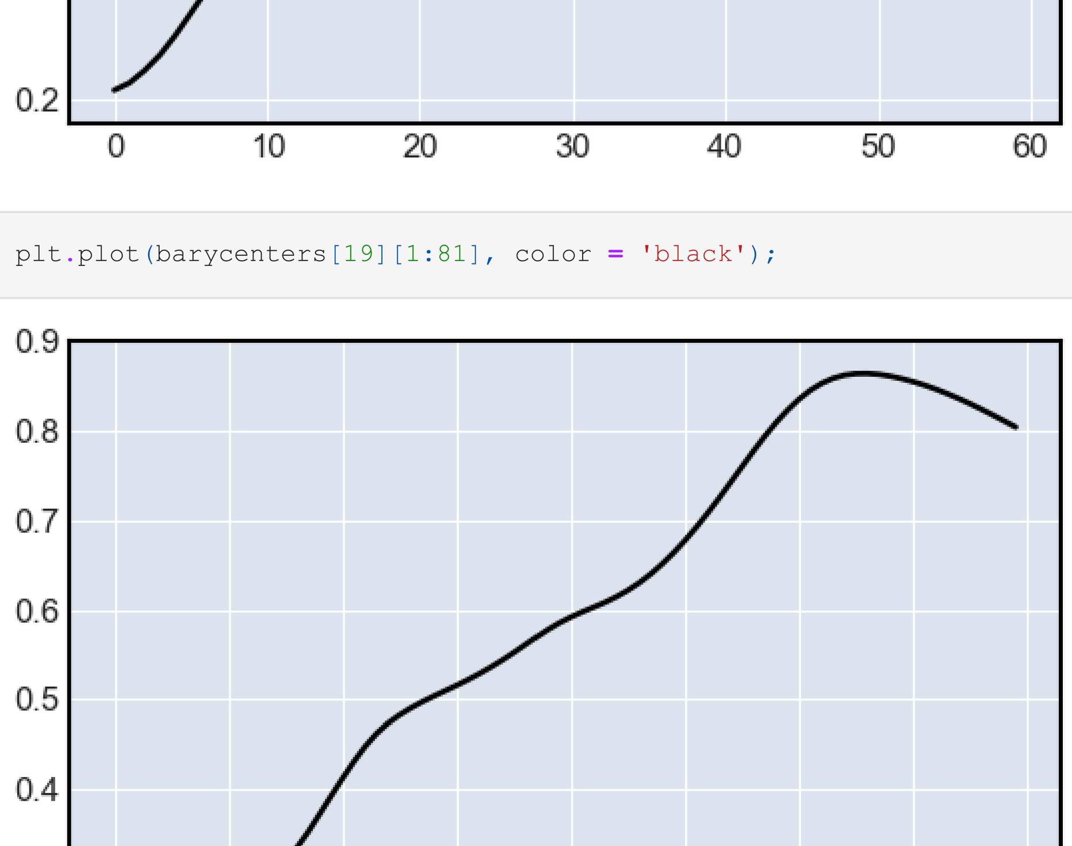
In [728…
```python
plt.plot(barycenters[2], color = 'black');
```



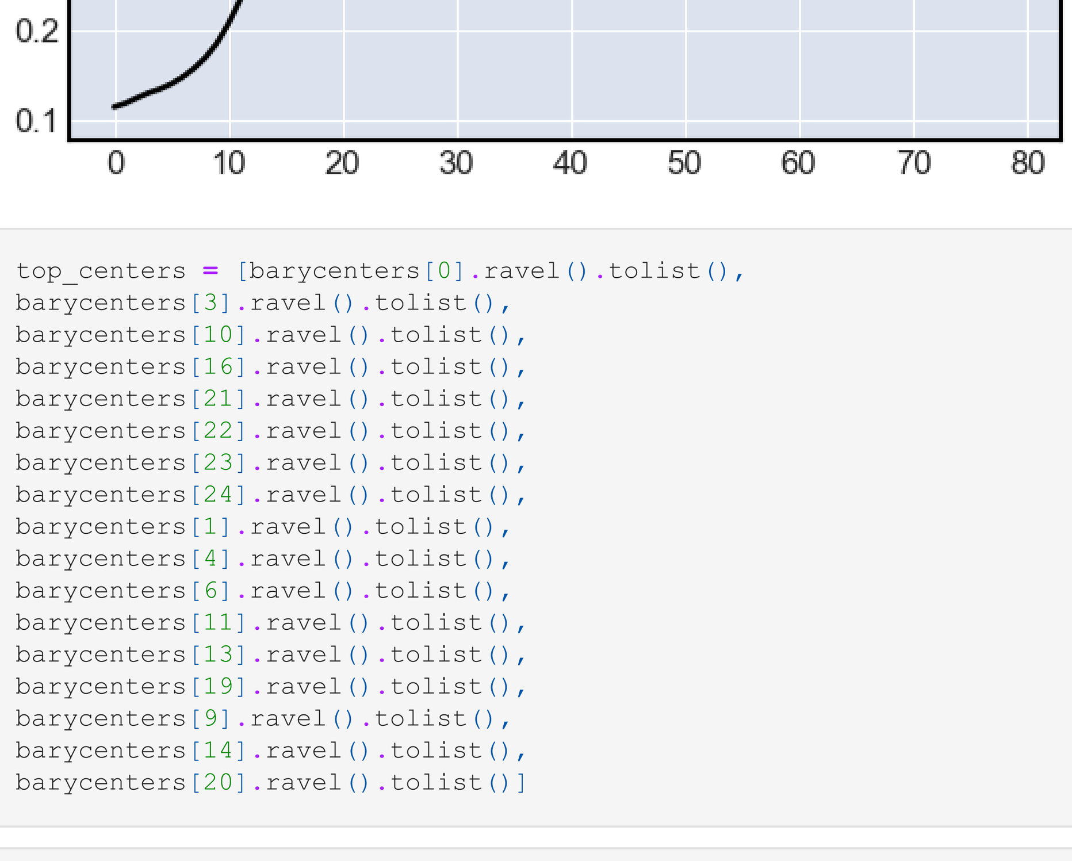
In [543…
```python
plt.plot(barycenters[6][1:31], color = 'black');
```



In [564…
```python
plt.plot(barycenters[9][1:61], color = 'black');
```



In [565…
```python
plt.plot(barycenters[19][1:81], color = 'black');
```



In [757…
```python
top_centers = [barycenters[0].ravel().tolist(),
barycenters[3].ravel().tolist(),
barycenters[10].ravel().tolist(),
barycenters[16].ravel().tolist(),
barycenters[21].ravel().tolist(),
barycenters[22].ravel().tolist(),
barycenters[23].ravel().tolist(),
barycenters[24].ravel().tolist(),
barycenters[1].ravel().tolist(),
barycenters[4].ravel().tolist(),
barycenters[6].ravel().tolist(),
barycenters[11].ravel().tolist(),
barycenters[13].ravel().tolist(),
barycenters[19].ravel().tolist(),
barycenters[9].ravel().tolist(),
barycenters[14].ravel().tolist(),
barycenters[20].ravel().tolist()]
```

In [761…
```python
#np.save('top_centers.npy',top_centers)
```

In [17]:
```python
top_centers = np.load('top_centers.npy', allow_pickle=True)
```

Посчитаем dtw попарные расстояния со всех 346394 наблюдений до этих центров кластеров:

In [ ]:
```python
all_dists = []
for n in tqdm(range(len(top_centers))):
    dists = []
    s1 = np.array(top_centers[n])
    for i in tqdm(range(len(train_list))):
        parent_dir_train = 'C:/Users/Kuanysh/Downloads/pump_and_dump/train3'
        ticker_name = train_list[i][0]
        day = train_list[i][1]
        s2 = pd.read_csv(os.path.join(parent_dir_train, ticker_name + '_'+ day +'.csv')).to_numpy().ravel()
        if len(s2)>=300:
            dist = dtw.distance_fast(s1, s2, window=60)
        else:
            dist = 50
        dists.append(dist)
    all_dists.append(dists)
```

In [795…
```python
#np.save('all_dists.npy', all_dists)
```

In [23]:
```python
all_dists = np.load('all_dists.npy')
```

Выберем только те наблюдения, dtw расстояния до которых меньше 1.5:

In [24]:
```python
all_classes = []
for dist in all_dists:
        dist_ = np.hstack((np.arange(0,len(train_list)).reshape(len(train_list),1), np.array(dist).reshape(len
        df_dist = pd.DataFrame(dist_, columns=['number','dist']).sort_values(by='dist', ascending=True)
        df_dist_ = df_dist[df_dist['dist']<=1.5].to_numpy()[:,0].tolist()
        all_classes.extend(df_dist_)
idx, freq = np.unique(all_classes, return_counts = True)
coef = len(all_classes)/idx.shape[0]
coef
```

Out[24]:
```
2.0522660270823962
```

In [25]:
```python
by_freq = np.stack((idx, freq), 1).astype(int)
sorted_by_freq = by_freq[by_freq[:,1].argsort()][::-1]
```

In [26]:
```python
new_train_list = []
for i in by_freq[:,0]:
    new_train_list.append(train_list[i])
```

In [27]:
```python
len(new_train_list)
```

Out[27]:
```
40026
```

Таких близких к этим центрам кластеров всего 40026 наблюдений, сформируем датасет рядов из них:

In [23]:
```python
tss = []
for item in new_train_list:
    ticker = item[0]
    date = item[1]
    parent_dir_train = 'C:/Users/Kuanysh/Downloads/pump_and_dump/train3'
    ts = pd.read_csv(os.path.join(parent_dir_train, ticker + '_' + date +  '.csv')).to_numpy().ravel()
    tss.append(ts)
```

In [29]:
```python
#np.save('tss1.npy', tss)
tss = np.load('tss1.npy', allow_pickle=True)
```

Датасет огромный, поэтому вычислим матрицу попарных расстояний на суперкомпе Вышки:

In [ ]:
```python
#!/bin/bash
#SBATCH --job-name=link_matrix1
#SBATCH --time=36:00:00
#SBATCH --error=stderr.%j.txt
#SBATCH --output=stdout.%j.txt
#SBATCH -c 40
#SBATCH -N 1

#source my_env/bin/activate
#python link_matrix1.py arg1 arg2
```

In [ ]:
```python
dist_matrix = dtw.distance_matrix_fast(tss, window=60, compact=True)
dist = squareform(dist_matrix)
#np.save('dist_dtw2.npy', dist_dtw) # около ~12Gb
```

Также на суперкомпе Вышки вычислим linkage матрицу расстояний и проведем иерархическую кластеризацию:

In [ ]:
```python
import fastcluster # используем эту библу на C++ для более быстрого (~ в 10 раз быстрее) подсчета linkage матри
dist_dtw = np.load('dist_dtw2.npy')
linkage_matrix = fastcluster.linkage(dist_dtw, method = 'ward')
#np.save('linkage_matrix_dtw2.npy', linkage_matrix)
```

In [42]:
```python
#Загрузим linkage_matrix, рассчитанной на суперуомпьютере вышки:
linkage_matrix = np.load('linkage_matrix_dtw3.npy')
```

In [43]:
```python
cluster_labels = fcluster(linkage_matrix, 500, criterion='distance')
labels, counts = np.unique(cluster_labels, return_counts=True)
```

In [44]:
```python
labels.shape
```

Out[44]:
```
(748,)
```

In [45]:
```python
new_list_arr = np.array(new_train_list).reshape(len(new_train_list),2)
cluster_labels = cluster_labels.reshape(len(cluster_labels),1)
new_arr = np.hstack((new_list_arr, cluster_labels))
print(new_arr.shape)
new_arr
```

```
(40026, 3)
```

Out[45]:
```
array([['SPI', '2020-09-23', '720'],
       ['GLSI', '2020-12-09', '666'],
       ['APM', '2020-09-29', '310'],
       ...,
       ['TWOU', '2020-02-04', '695'],
       ['WWR', '2021-06-07', '354'],
       ['AEG', '2020-03-11', '258']], dtype='<U11')
```

In [46]:
```python
# Создадим такой же датасет из 40026 рядов как и выше, только с метками кластеров:
time_series2 = []
for name, date, cluster in new_arr:
    parent_dir = 'C:/Users/Kuanysh/Downloads/pump_and_dump/train3'
    ts = pd.read_csv(os.path.join(parent_dir, name + '_' + date + '.csv')).to_numpy().ravel().tolist()
    time_series2.append([cluster, ts])
print(len(time_series2))
```

```
40026
```

In [47]:
```python
d = defaultdict(list)
for x, y in time_series2:
    d[x].append(y)
```

In [ ]:
```python
# теперь уже найдем центры для 748 кластеров:
barycenters = []
for keys, values in d.items():
    barycenter = softdtw_barycenter(values, gamma=0.1)
    barycenters.append(barycenter)
```

In [ ]:
```python
new_barycenters = []
for bc in barycenters:
    bc = bc.ravel()
    new_barycenters.append(bc)
#np.save('new_barycenters2.npy', new_barycenters)
new_barycenters = np.load('new_barycenters2.npy', allow_pickle=True)
```

In [ ]:
```python
dist_matrix_sbc = dtw.distance_matrix_fast(new_barycenters, window=30, compact=True)
dist_dtw_sbc = squareform(dist_matrix_sbc)
#np.save('dist_dtw_sbc2.npy', dist_dtw_sbc)
```

In [ ]:
```python
dist_dtw_sbc = np.load('dist_dtw_sbc2.npy')
linkage_matrix_sbc = fastcluster.linkage(dist_dtw_sbc, method = 'ward')
#np.save('linkage_matrix_sbc2.npy', linkage_matrix_sbc)
```

In [48]:
```python
